

## REMOTE INTERFACE

DB44 is loaded with a wide number of useful features such as TCP/IP connectivity, Interactive WEB server, audio streaming and automatic alerts on out of predefined ranges in regards with the ITU-R. All the monitoring parameters can be easily customized via the visual control interface in regards with a specific customer's need. In case of any faults in the transmission the maintenance staff will be immediately alerted via E-mail or SMS. Adjustable triggers watch to avoid sending of fake alarm messages. This tool enhances the radio stations' quality control management.

The built-in DB44 Oscilloscope represents the observed signal change over time, enables you to visualize the most important signals participating in the process of demodulating and stereo decoding. Similarly to the Oscilloscope mode, Spectrum analyzer is a mode for spectral analysis of the input signal and is a part of the DB44 features. Spectral components of the selected signal are determined on the base of Fast Fourier Transform. The MPX Power measurement, which supports measurement data history is yet another DB44 great feature.
